

Would you say that Deep Blue was intelligent? Explain.

Yes , Deep Blue was intelligent . Across it wins in the first attempt and its not a coincidence but it was made by Human Brain so, human brain is intelligent and powerful then this . Although human creates a lot thoughts and everything in the mind which blocks the neural parts of human brain . But we made a system which can directly works the specific terms and works and that is Deep Blue i.e it is intelligent, that's why AI should be powerful because we programme the systems in that basis.

What contributed to Deep Blue's success and how? Who/what should get credit for it?

Deep Blue's success came from a combination of very powerful hardware, special chess chips, and clever search algorithms. In the video, Kasparov talks about how Deep Blue was not "thinking" like a human, but was instead using enormous computing power to calculate far more positions than any person can do.

What implications do you think such digital assistants will have for people?

They'll make life easier by saving time .

They can help elderly people feel less lonely.

But they might collect too much personal data.

People might become too dependent on them.

What opportunities it might open for businesses?

Businesses can serve more customers at the same time.

They save money because one AI can do work of many humans.

They can work 24/7.

They can be more efficient.

Is Google Duplex narrow, general or super AI? Explain.

It only does specific tasks (like making appointments).

It cannot talk about anything or do many different things like a human.

It's not general AI (which can do many tasks) and not super AI (which is smarter than humans in everything).

What impressed you most in this demo?

It sounded so natural with "umms", "ahhs", and pauses – like a real human.

The person on the phone didn't realize it was a computer.

It could handle real conversations and complete tasks without human help.

What the author has to say about the importance of the Turing test? How Turing test is conducted?

The author says the Turing test is very important because it gives us a way to think about whether machines can really think like humans. Instead of asking the hard question can machines think?, Turing changed it to a more practical question: can a machine act so much like a human that you can't tell the difference?

How Turing test is conducted?

The Turing test is conducted like this:

A human judge talks to both a human and a machine through a computer (like by typing messages).

The judge doesn't know who is the human and who is the machine.

The judge asks questions and talks to both of them.

If the judge cannot tell the difference between the human and the machine (or guesses wrong more than 30% of the time), then the machine is said to have passed the Turing test.

What Turing predicted would happen by 2000? Did it happen in your opinion?

Alan Turing predicted that by the year 2000:

Computers would have about 100 megabytes of memory.

A computer would be able to play the Turing test game so well that an average judge would have no more than 70% chance of telling the machine from the human after 5 minutes of questioning.

Basically, computers would be smart enough to pass the Turing test.

In my opinion, no, it didn't fully happen by 2000. Even though computers have gotten much faster and more memory, we still don't have AI that can consistently pass the Turing test in real conversations.

What parts of Mitsuku's 2016 transcript resemble human conversation the most?

Mitsuku is a chatbot that won the Loebner Prize in 2016. From what I saw, the parts of Mitsuku's transcript that look most like human conversation are:

Mitsuku uses casual language

Mitsuku asks questions back to the person

Mitsuku makes small mistakes

Mitsuku talks about everyday topics I

Mitsuku responds quickly and doesn't give overly long

Who was Eugene Goostman?

Eugene Goostman was a chatbot created by Russian scientists at the University of Rochester. The chatbot was designed to pretend to be a 13-year-old boy named Eugene Goostman.
